Oracle Cerner Celebrates HIMSS Stage 7 and Davies Client Achievements

by Oracle Cerner

Published on August 29, 2022

Oracle Cerner is excited to celebrate clients that have achieved top HIMSS Electronic Medical Record Adoption Model (EMRAM) Stage 7 validation, the highest recognition for hospitals that have embraced technology enhancements including the shift from paper to electronic health records (EHR). At a time when the healthcare industry faces significant challenges from slow adoption of technology, to clinician burnout, and to inequities in healthcare access, these hospitals and health systems have prioritized themselves in an increasingly competitive market.

EMRAM model validations measure clinical adoption of EHR technology to support organizational goals.

Since 2021, Oracle Cerner has supported more than 100 hospitals in achieving EMRAM Stage 7 validation. Examples of clients adopting technology to improve patient satisfaction include:

- 1 Adventist Health
- 2 Antelope Valley Medical Center
- 3 Children's Health of Orange County
- 4 Covenant Health
- 5 Hutchinson Regional Medical Center
- 6 Intermountain Healthcare
- 7 King Faisal Specialist Hospital & Research Center
- 8 MLK Community Healthcare
- 9 **Memorial Hermann Health System ***
- 10 Northern Light Health
- 11 University of Missouri Health Care

- **Antelope Valley Medical Center** in California

The medical center uses several tools including Oracle Cerner technology for its antimicrobial stewardship program. This allows pharmacists to advance the appropriate use of antimicrobials to support their goals of reducing overall antibiotic use for non-bacterial diseases, optimizing antibiotic use for bacterial infections, and improving patient outcomes while eliminating unnecessary patient-care costs.

- **Hutchinson Regional Medical Center (HRMC)** in Kansas received a medal from the US

Why big health systems are moving to Epic

Giles Bruce - yesterday

Two large health systems — Atlanta-based [Emory Healthcare](#) and Houston-based [Memorial Hermann](#) — recently switched their EHRs from Oracle Cerner to Epic, continuing a trend of bigger hospital groups moving to the Verona, Wis.-based software giant.

Several health system CIOs and other IT leaders told *Becker's* the reasons for this include the desire to consolidate to one EHR from multiple vendors, with Epic being the most dominant player, while others said not to put too much stock in the name of the companies as the EHRs are fairly similar and depend on what your patients and clinicians are looking for.

"When you've seen one health system, you've seen one health system," said Aaron Miri, senior vice president and chief digital and information officer of Jacksonville, Fla.-based Baptist Health.

But he said Baptist Health went to Epic, a transition completed July 30, to integrate into a single EHR.

"While I can't speak for other health system's reasons, I do think that healthcare is becoming so complicated with so many intersecting levels of care that all health systems must be asking themselves how to simplify the equation and make care delivery a much more seamless experience for providers and patients alike," he said.

"In the U.S., Epic is especially compelling in large systems," he said. "It simply solves more problems and scales better. Epic's strict implementation practices mean you will end up with a functional system, even if it isn't fabulous."

Industry Perspective

https://www.beckershospitalreview.com/ehrs/why-big-health-systems-a-re-moving-to-epic.html?origin=CIOE&utm_source=CIOE&utm_medium=email&utm_content=newsletter&oly_enc_id=2515J3520389E9Q

101

Oracle Cerner 101 - **What it does?**

- Executive Summary
- Solution
 - Common Process Map
 - Workflows
- Product
 - Main screen patterns (Organizer, Patient)
- Implementation (stabilization, perpetual optimization)
 - Industry Standard Implementation Patterns
 - DOD pattern (circa HIMSS 2021)
 - VA Pattern - extending and/or Reinventing a VA pattern
- Industry Perspective
 - Implementation experience, both leading EHRs
 - Safety, Satisfaction, and Usability
 - HIMSS Electronic Medical Record Adoption Model

Essential Processes:

Common Process Map

1. Identify *
2. Assess
3. Plan
4. Order *
5. Schedule
6. Perform
7. Document
8. Account *

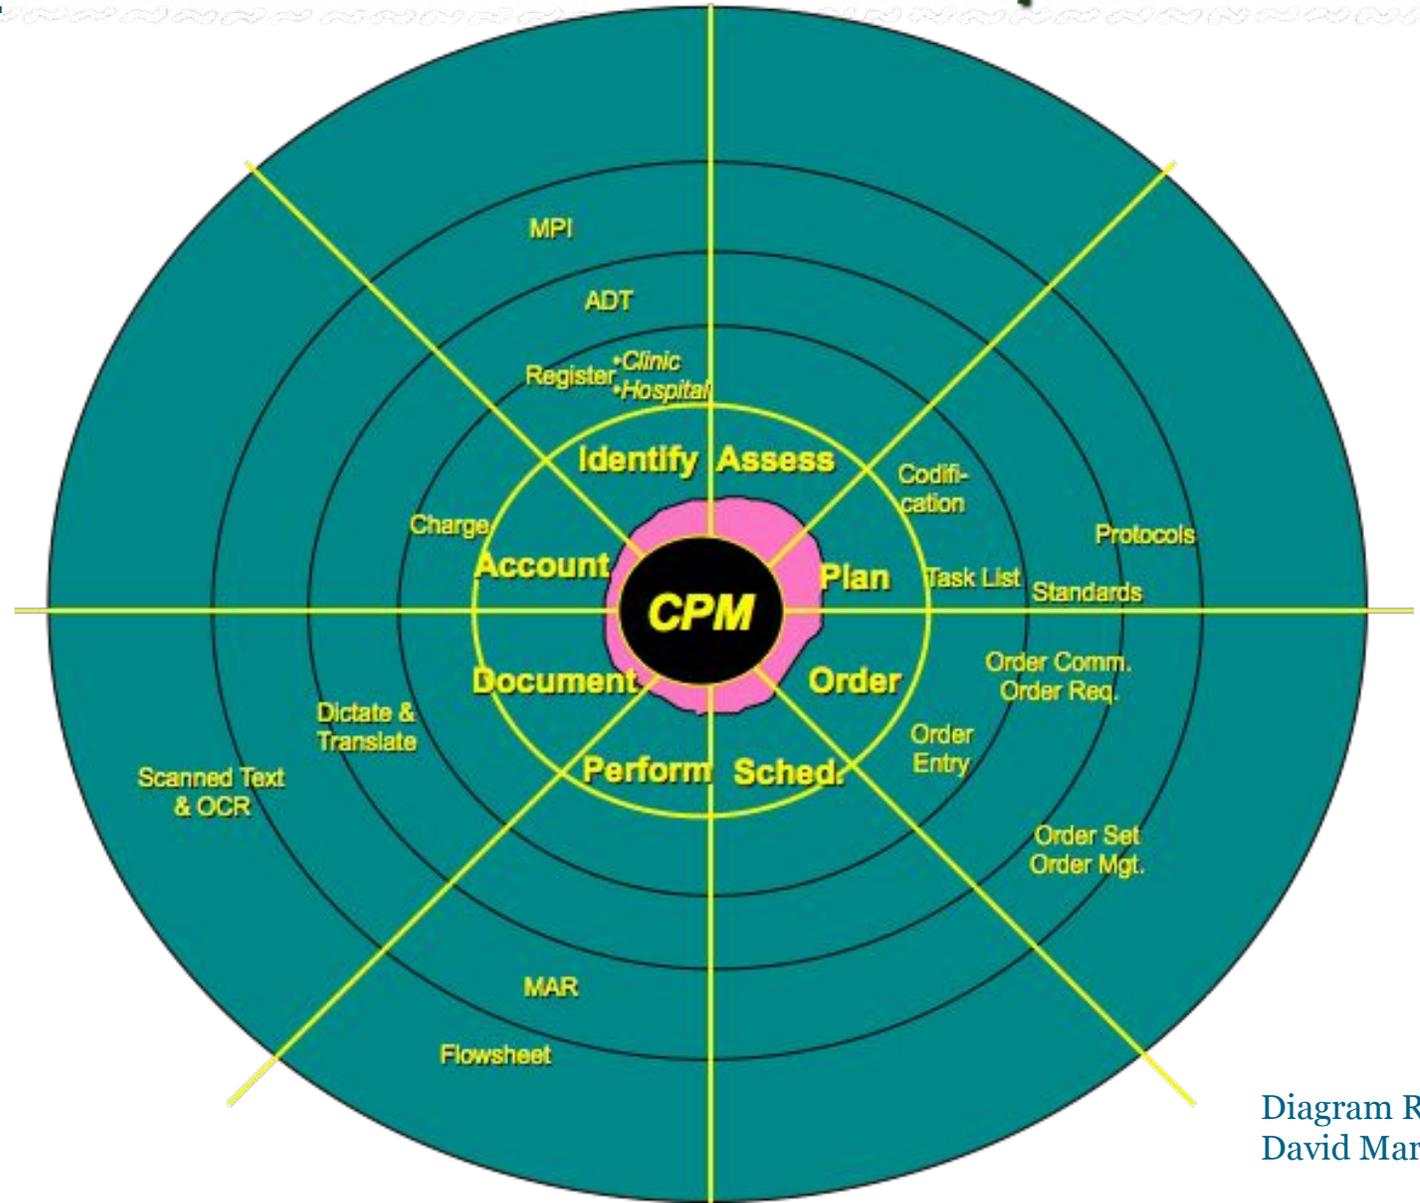

Diagram Reference:
David Margulies

* These 3 processes are the first to be standardized within then across each institution. Identity management continues to be a challenge internationally. Order catalogues vary as do the resulting charge description masters.

Workflows

Identify	Registering a new patient
Assess	Completing an assessment template such as vital signs
Plan	Reviewing an existing standard clinical practice guideline, selecting relevant branches
Order	Ordering a medication, lab or radiographic exam; also discontinuing, reordering, discharging, reversing a discharge, etc
Schedule	Scheduling a referral
Perform	Performing a procedure such as a blood draw for a lab test or administering a medication
Document	Entering, reviewing and signing a clinical note such as a discharge summary
Account	Completing a billing form such as a UB-04

301

Oracle Cerner 301 - **Success at national levels**

- Executive Summary
- Implementing Oracle Cerner is **in service of**
 - Financial: Profit/Cost
 - Access: Government role in health care
 - Quality: Measurement and outcomes
- International Health Care Systems by Country
 - Single payer vs single provider vs single 'payvider'
 - Sample Countries
- Leveraging *lessons learned*
 - Overcoming obstacles
 - Major postures relative to users
 - **Core** - platform deployment expertise
 - **Context** - capabilities that shouldn't be Core
- Nobler Motives - a bright future
 - RWE: UK (Landray, Horby); Israel and Covid

Executive Summary of Oracle Cerner as an EHR

	Oracle Cerner	Other Industry Leader	Context
Origins	Publicly traded	Privately held	
Large system “chops”	Catching up	Strong	
Originated in	Inpatient	Ambulatory	Both vendors integrate multiple care settings with a single database view of all patients.
Philosophy	An expansive, flexible toolkit, capable of supporting wide usage patterns	A focused platform strongly supporting narrow usage patterns with longer-standing investments in end-user experience and implementation.	
Sameness	<p>Both systems support the same workflows (registration, chart review, ordering, departmental performance, records management)</p> <p>Both have substantially similar GUIs, largely replicating 1990s ‘Windows’ look-and-feel (cf Google, Amazon, cloud-native dynamic predictive displays and elastic response times.)</p>		Both vendors loudly acknowledge that their architecture and technology is rooted in the 1980s and 90s. Functionality and usability gains will come from AI/ML.
Differences	Lagging rev cycle, Less rigorous product mgmt and implementation methodology.	“Product is not exceptional. It is not exceptionally good or bad.”	Product strength (“Capability Gaps and Limitations”) and implementation issues noted in this deck and external audits.

International Context of Achieving a Successful EHR.

NB: VA Complexity Burden is High.

	← more private → more public →				"Best/Worst of both worlds"
	Massachusetts (within USA)	Netherlands	Norway	England (within UK)	
Population size (health spending in % GDP, 2018)*	6.9M (16.9%)	17.2M (10%)	5.3M (10.5%)	56.0M (10%)	
Universal health coverage	Multipayer system with mandated minimum level of coverage	Multipayer with mandated insurance of basic services	Single-payer system, with coverage for all services	Single-payer system, with coverage for all services	
Role of government	<ul style="list-style-type: none"> Federal and state govt. provide Medicare and Medicaid Sets the minimum level of covered services Since 2012. Health Policy Commission annually sets the spending growth benchmark 	<ul style="list-style-type: none"> Defines the basic set of services annually Sets priorities and supervises market & access Pays capitation per member to insurers (via taxation); members also pay premium 	<ul style="list-style-type: none"> Taxation-based health system with one national health insurance body Govt. runs Regional Health Authorities for specialty care, municipalities for primary care 	<ul style="list-style-type: none"> Funding for the UK's National Health Service (NHS) comes from tax revenue. NHS owns most of the hospitals and employs medical providers 	
Role of private players	<ul style="list-style-type: none"> 40% of MA spending is funded by private payers Employers can negotiate with providers directly Two big health systems in MA: Mass General Brigham and Beth Israel Lahey Health 	<ul style="list-style-type: none"> Non-profit insurers provide mandated & supplemental coverage (87% of pop.) Insurers and providers can experiment with value-based payments Providers and insurers compete on health purchase market on price & quality 	<ul style="list-style-type: none"> 85% of spending is public; supplementary coverage available Private providers offer primary and specialty care with out-of-pocket payment 	<ul style="list-style-type: none"> Some private providers for elective services, which are paid out-of-pocket or through private supplemental coverage (10% of population)

Using EHR platforms: essential to achieving effective interoperability

Interoperability

to achieve national and international objectives requires challenging development organizational models, institutional clinical knowledge management, and exchange (e.g. closed-loop referral)

Four Levels of Interoperability

- **Foundational (Level 1):** Establishes the inter-connectivity requirements needed for one system or application to securely communicate data to and receive data from another
- **Structural (Level 2):** Defines the format, syntax and organization of data exchange including at the data field level for interpretation
- **Semantic (Level 3):** Provides for common underlying models and codification of the data including the use of data elements with standardized definitions from publicly available value sets and coding vocabularies, providing shared understanding and meaning to the user
- **Organizational (Level 4):** Includes governance, policy, social, legal and organizational considerations to facilitate the secure, seamless and timely communication and use of data both within and between organizations, entities and individuals. These components enable shared consent, trust and integrated end-user processes and workflows

The project include a T3/L4 component, a Provider and Patient facing app in order to explicitly tests the requirements and artifacts in an early and Agile manner. (dotted red line including SDoH components)

The natural history of large EHR roll outs paints an informative, cautionary tale.

BCG's Foundation

Approach to:

- Legitimacy
- Policy
- Action

in service of

Implementation,
Adoption,
Stabilization,
Benefit Attainment

Legitimacy	Stakeholder engagement	Political commitment	Public confidence
	Fair	Good	Fair

Policy	Clarity of objectives	Strength of evidence	Feasibility
	Fair	Fair	Fair

Action	Management	Measurement	Alignment
	Weak	Fair	Weak

Stakeholder engagement

The main stakeholders were the UK government, principally the Department of Health, the NHS (its employees and patients), and Connecting for Health (CFH), the agency responsible for the design, development and implementation of NPfIT. During the design phase there were private sector stakeholders such as CSC and Accenture. There has been criticism that the views of its prospective endusers were not addressed (see Masurement below). "A criticism of the programme has been that it has not reflected the needs of the NHS. The number of stakeholders involved is vast and contains many categories, including clinician, managerial, technical, informatics, and professional bodies. The management of and engagement with stakeholders appears to have been less than systematic and rigorous during the life of the programme."[\[8\]](#)

There were other stakeholders in EHR planning and development in England. "In England, EHR planning is managed by NHS England, the National Information Board (NIB, which develops priorities for data and technology for the Department of Health) and the Health and Social Care Information Centre (HSCIC, a non-departmental public body which manages information, data and IT systems for health and care)."[\[9\]](#)

After the implementation, there was no interest among the stakeholders working to deliver the programme. "The computer software was secret and proprietary. There was no accountability to the public, and the vendors did not provide enough technical support to clinicians having trouble using the records."[\[10\]](#)

The key challenges for implementing new systems

Notes from an exec with first hand Cerner and Epic implementation experience

- It's a massive institutional brain transplant, typically after go-live, much feels like going backward until stable enough to optimize
- There are often “necessary” changes in roles, responsibilities, and how work gets done
- Must balance maximal engagement with necessity to get decisions made with agility
- Must balance “convergence” with localization, endless trade-offs
- Must invest in data migration and chart-prep resources
- Challenging to identify and uncover for all “exception” scenarios in testing
- Training must be “team” focused, not just user focused
- **Must expect long post-go-live investments in adoption and operational evolution;** Optimization is an eternal process

2022 AMIA - Navigating Electronic Health Record Transitions

Premature Customization

This is a recurring issue across vendors:

- in most implementation projects, the users want to start torquing and customizing the system before they know how to operate the base system
- they are anchored to their current thinking about how workflow should work, and this can result in breaking system integration points, weakening the workflow reliability etc
- causing all sorts of mayhem beyond the usual unexpected stuff

It's **really important to stick to the recommended foundation workflows** and follow vendor leadership in determining what can be safely altered, what are the available options for customization, and then "move into the new house" and "use it for a few months" before you start major changes to workflow and process assumptions

- **people ultimately will forget how they used to get their work done**, how the teamwork used to unfold, adopting the new system, and develop new perceptions of how they want to optimize anchored in the new system assumptions of how to play to system strengths -

Above is pretty important - I have often told my users

- ***" you don't know for sure how you want to perfect a system until you actually are living in it - before that, it's all abstract and your assumptions are probably not correct about how you think you want it to work"***, this is also why, after a go-live, it's a skeletal system with lots of little issues and gaps - and a lot of fixes that the organization has to staff up to quickly address (printers, role-based security settings, networks, devices, etc) and get the users learning the sport of using the system before progressing to major optimization efforts -

VA* end-user experiences with “Cerner” elaborated in Inspector General Reports (multiple reports, OIG, congressional hearings)

*Few is any complaints from DOD implementation of same software on same single instance.

Participants (users) expressed concerns with

- Training
- End user device integration
- Issues reporting and ticketing
- General User Sentiment: "Too Many Clicks, Too Slow"
- Slow System Response
- System Errors
- " More Effort Required to Provide Less Care"
- Configuration Mapping to User Needs
- System Usability Issues
- Technical Findings
- Lights On Network / Performance Measurement

Management expressed concerns with

- Patient harm (OIG) “undefined queue”
 - failed to deliver more than 11,000 orders for specialty care, lab work and other services at Mann-Grandstaff VA Medical Center
- Pharmacy

Oracle Health's plans as messaged in their HIMSS 23 booth

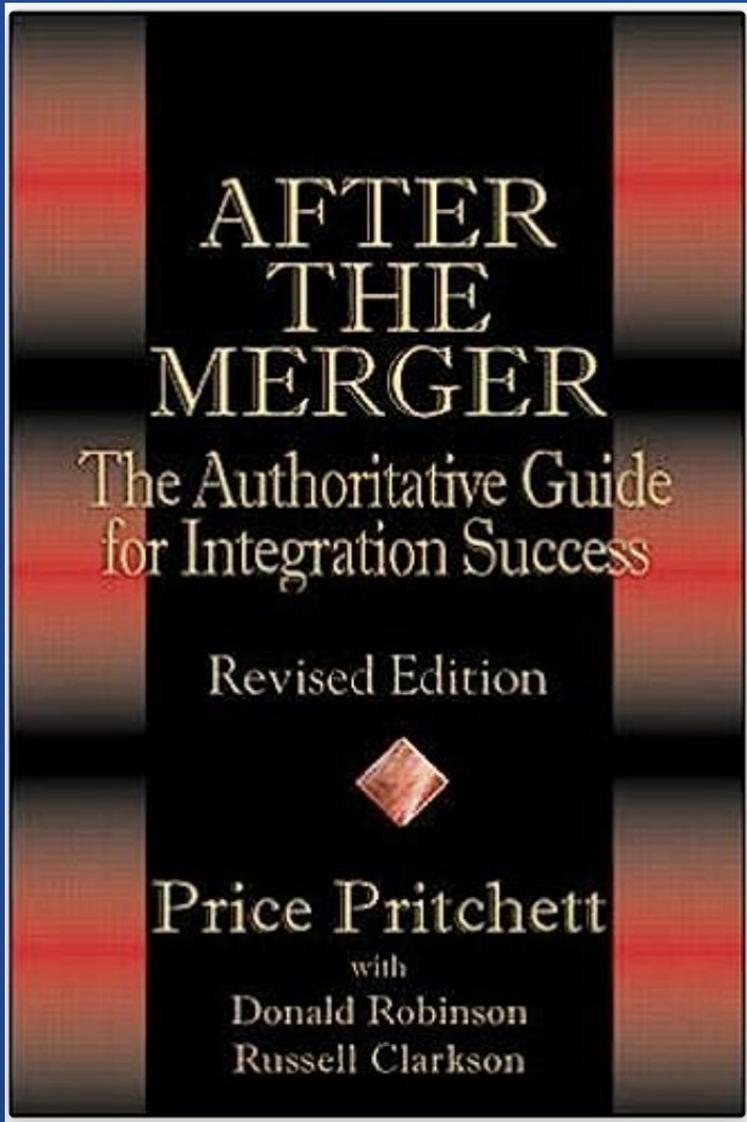

Oracle intends to become

- **primarily a cloud vendor**
- **application software provider**
- **platform provider for innovative solution providers**
- **(not interested**
 - **application development**
 - **implementation services**
